(54) Title: **METHOD FOR RECORDING INFORMATION ON A RECORD CARRIER, A RECORD CARRIER AND A  
RECORDING DEVICE**

(57) Abstract: A record carrier comprises two layers that react with each other when irradiated to form a mark on the record carrier. The two layers are separated by a third layer that prevents direct contact of the two layers thus providing stability to the record carrier. By irradiating the third layer a region of the third layer is destroyed or altered whereby an opening is created and the reaction of the two layers is no longer prevented in that region and a mark can be formed. The size of the resulting opening determines the size of the mark and can thus be used to create a very small mark allowing high density recordings.
